The flat rate figures given in the flat rate chart are the result of repeating the various operations a number of times to establish an average time for each repair operation. The times are based upon the use of special tools, upon average skill and speed, and upon the procedures in this manual.

The figures are a practical and useful guide in establishing prices for various repair operations. Because some mechanics are, naturally, faster than others, the figures cannot be considered exact, but they are time allowances within which any mechanic can stay. The figures, generally speaking, will apply to any make or model. Of course, there are minor variations, but they are so slight that it is safe to say they will have no bearing on average time allowances which have enough leeway to cover make and model variations.

The time schedules are broken down into increments of 10ths of hours, or 6-minute intervals. To aid you in translating these figures into dollar costs, there is a computation table below. These are labor charges only, based upon labor rates in given areas. Parts cost are extra, and naturally depend on the number and type of parts replaced. For parts costs, see your local jobber.
